

## Australian Investment Performance 1959 to 2013 (and Investment Assumptions for Stochastic Models)

## Colin Grenfell

## Presentation

## Why? <br> What?

How? ... briefly
Results ... some of the 82 charts
... just 4 of 30 tables
Acknowledgments

## Why?

## -Demand versus supply gap

$>$ in Australia
$>$ for many sectors
$>$ often for commercial reasons
>particularly, data for long term assumptions and
>little documented assumption methodology

## Demand "pull"

>Actuaries use investment assumptions in all practice areas
$>$ For premium or contribution rate calculations
>For valuations, capital assessments, investment strategy calculations, etc
$>$ For benefit and other projections
$>$ And, what is the impact of the global financial crisis (GFC)?

## Supply "push"

-Valuable 54-year database:
$>E F G$ investment system (48 years)
$>$ Published indices and rates (4-54 years)
-l'm keen to see Australian actuaries make greater use of:
$>$ Stochastic models
$>$ Historical simulations
$>$ Auto-correlations
>Economic cycles

## What?

(1) Australian investment performance 30 June 1959 to 30 June 2013

## [question time] and

(2) Investment assumptions (realistic) for stochastic (and deterministic) models
[more questions]

## What? Growth Securities, Interest Income and Financial Indicators

| - S | Australian shares |
| :--- | :--- |
| - I | International shares (unhedged) |
| - H | International shares (hedged) |
| - Q | Property trusts |
| - P | Direct property |

| - X | CPIndex (annual increase) |
| :---: | :---: |
| - W | AWOTE (annual increase) |
| - B | 90-day bill rates (mid-year) |
| - D | 10-year bond rate (mid-year) |

| - F | Australian fixed interest |
| :--- | :--- |
| - J | International fixed interest (hedged) |
| - G | Government semis (0 to 3 yrs $)$ |
| - N | Inflation-linked bonds (0 + yrs) |
| - L | Loans (floating rate) / Credit |
| - C | Cash |

## What? Statistics

- Risk margins (over 10-year bond rates)
- Coefficients of variation (of rates)
- Skewness (of forces)
- Kurtosis (of forces)
- Cross-correlations (of forces)
rank and standard
- Auto-correlations (of forces)
- Arithmetic means (44 years)
- Compound means (44 and 40 yrs)
- Standard deviations (44 years) [sec. 8
- "Balanced" and "Capital stable"
- Gross/net of superannuation tax sec. 17
- Gross/net of wholesale passive fees sec. 18

## 44-year Average (compound) Returns pa

## QUESTIONS ?

Demand and supply
Database
15 sectors
Backdating
44-year returns
GFC
Cycles
Sine curves

## How? Assumptions - Methodology

Step 1 Sep, Dec, March, June data
Step 2 determine calculation periods (see previous slides)
Step 3 annual statistics
Step 4
10 "running" averages (of 4)
Step 5 quadratic trend and
6 year projection
Step 6 year-2 (and judgment)
see Section 2

## Appendices

## A Modelling Skewness and Kurtosis

Normal power approximation, and a gamma exponential variable
B Modelling Auto-correlations Shares (S sector) - one extreme Bonds (D sector) - other extreme

## C Austmod Investment Simulation Model

The 26 inputs are described
"Historical random start" modelling defined Summary of algorithms and output

## Concluding Remarks Section 20

It is desirable for the setting of long-term assumptions to analyse results over at least one full economic cycle
The 'sum of two sine curves' technique is a powerful tool for analysing economic cycles but a single sine curve is sometimes preferable
Care is needed when using running averages because their trends are impacted by the old data dropping off
The impact of the GFC was not an isolated event
Skewness and kurtosis assumptions for many sectors indicate that their return distributions are not normal or lognormal
There is a slight negative bias in Balanced portfolio (and share) autocorrelations up to a lag of about 5.5 years
Average 26 -year $S$ and $D$ auto-correlations indicate some stability after rescaling the $x$-axis
Historical net returns can be used to illustrate the adequacy and the inadequacy of Australia's $12 \%$ SG contribution rate
A fixed input (such as $12 \%$ of salary) will produce a variable output, with significant variation in lump sum retirement benefits depending on your chosen normal retirement date

## Paragraph 4.3

"Of major significance was the introduction in 1965 of a selective investment facility known as the EFG system. Evidence of the success and wide acceptance of this concept, which was pioneered by National Mutual in Australia, may now be seen in the fact that it has since been adopted by a number of other financial institutions as a medium for superannuation investment."
